Backrest and Method for Making Backrest

1	
2	

3 Field of Invention

- 4 The present invention relates to a backrest and, more particularly, to a
- 5 method for making such a backrest.

6

7

Background of Invention

- 8 A typical chair for use in an office includes a seat and a backrest. The
- 9 seat and the backrest are both made from foam material so as to provide a
- soft feeling to a person sitting in the chair. However, the backrest made
- of foam material is not good for dissipating heat produced by the person.
- Moreover, the backrest made of foam material is heavy and bulky and,
- hence, not economic regarding transportation.

14

- 15 The present invention is therefore intended to obviate or at least alleviate
- the problems encountered in prior art.

17

18

Summary of Invention

- 19 It is an objective of the present invention to provide a backrest with good
- dissipation of heat produced by a person's back laid against it.

21

- 22 It is another objective of the present invention to provide a backrest that is
- 23 light in weight and compact in size.

- 25 According to the present invention, a backrest includes a frame, a web
- 26 and a ring. The frame includes a margin and two rims extending on a

- side of the margin and a gap defined between the rims. The web is
- 2 spread on the side of the frame. The ring is put on the web and fit in the
- annular groove so that the web is tightly spread on the frame.

4

- 5 Other objects, advantages and novel features of the invention will become
- 6 more apparent from the following detailed description in conjunction
- 7 with the attached drawings.

8

9 Brief Description of Drawings

- 10 The present invention will be described via detailed illustration of
- embodiments referring to the drawings.

12

- 13 Figure 1 is a flowchart of a method for making a backrest according to
- the preferred embodiment of the present invention.

15

- 16 Figure 2 is an exploded view of a backrest according to the preferred
- embodiment of the present invention.

18

19 Figure 3 is a cross-sectional view of the backrest of Figure 2.

20

- 21 Figures 4-9 are perspective views of a mold assembly in various steps of
- 22 the method of Figure 1 for making the backrest of Figure 2.

23

Figure 10 is a perspective view of the backrest of Figure 1.

25

26 Figure 11 is a perspective view of the backrest of Figure 10 used in a

1 chair.

2

3

Detailed Description of Embodiments

- 4 In accordance with the preferred embodiment of the present invention, a
- backrest shown in Figures 2, 3, 10 and 11 is made in a method shown in
- 6 Figures 1 and 4-9.

7

- 8 Referring to Figure 2, the backrest includes a frame 10, a web 20, a ring
- 9 30, a cushion 40 and a cover 50. The frame 10 includes a margin 11 and
- 10 two rims 12 extending on a front side of the margin 11. A gap 13 is
- defined between the rims 12.

12

- 13 Referring to Figure 3, the web 20 is put on a front side of the frame 10.
- 14 The ring 30 is put on a front side of the web 20. The ring 30 and an
- annular portion of the web 20 are fit into the annular groove 13. Thus,
- the web 20 is tightly spread on the frame 10, i.e., tension is produced in
- the web 20. The cushion 40 is put in the frame 10. The cushion 40 is
- compressed between the margin 11 and the web 20. Thus, the web 20 is
- more tightly spread on the frame 10, i.e., the tension in the web 20 is
- 20 increased. The cover 50 is installed around the frame 10.

- Referring to Figures 1 and 4, at step S10, a mold assembly is provided.
- 23 The mold assembly includes a lower mold 60, a middle mold 62 and an
- upper mold 70. The lower mold 60 defines a cavity 61 in an upper side.
- 25 The profile of the cavity 61 is compliant with that of the backrest. The
- profile of the middle mold 62 is compliant with that of the cavity 61.

- 1 The upper mold 70 defines a cavity 71 in a lower side. The profile of
- 2 the cavity 71 is compliant with that of the middle mold 62.

3

- 4 Referring to Figures 1 and 5, at step S15, the frame 10 is put in the cavity
- 5 61. The rims 12 face up.

6

- 7 Referring to Figures 1 and 6, at step S20, the middle mold 62 is lowered
- 8 against the margin 11. Thus, the frame 10 is held in position. The rims
- 9 12 are exposed.

10

- 11 Referring to Figures 1 and 7, at step S25, the web 20 is laid on the middle
- mold 62. The web 20 covers the rims 12.

13

- Referring to Figures 1 and 8, at step S30, the ring 30 is put on the web 20.
- 15 The ring 30 and an annular portion of the web 20 are forced into the
- annular groove 13. Thus, the web 20 is tightly spread on the frame 10.

17

- 18 Referring to Figures 1 and 9, at step S35, the upper mold 70 is lowered
- 19 against the ring 30. High frequency is exerted on the frame 10, the web
- 20 20 and the ring 30. Thus, the frame 10, the web 20 and the ring 30 are
- 21 heated and therefore partly melted. The frame 10, the web 20 and the
- ring 30 adhere to one another when they cool down.

- 24 Referring to Figure 1, at step S40, the upper mold 70 is lifted from the
- 25 ring 30 and returned to its original position. The middle mold 62 is
- 26 lifted from the lower mold 60 and returned to its original position.

- 1 At step S45, the frame 10, the web 20 and the ring 30, as a whole, are
- 2 moved from the middle mold 62.

3

- 4 At step S50, the cushion 40 is put in the frame 10. The cushion 40 is
- 5 compressed between the margin 11 and the web 20. Thus, the web 20 is
- 6 more tightly spread on the frame 10.

7

8 At step S55, the cover 50 is installed around the frame 10.

9

10 At step S60, the backrest is finished.

11

- 12 The present invention has been described via detailed illustration of some
- 13 embodiments. Those skilled in the art can derive variations from the
- 14 embodiments without departing from the scope of the present invention.
- 15 Therefore, the embodiments shall not limit the scope of the present
- invention defined in the claims.

17
